PABT III. INTEGRAL CALCULUS. Object of the Integral Calculus. 59. The object of the integral calculus is to pass from a given differential to a function from which it may have been derived. This function is called the integral of the differential, and the operation of finding it is called integration. The operation of integration is indicated by this sign, /, called the integral sign. Integration and differ entiation are inverse operations, and their signs, when placed before a quantity, neutralize each other; thus, dx =x. A constant quantity connected with a function by the sign of addition, or subtraction, disappears by differentiation, hence, we must add a constant to the integral obtained; and inasmuch as this constant may have any value, it is said to be arbitrary. The integral, before the addition of the constant, is called incomplete, after its addition it is said to be complete. By means of the arbitrary constant, as we shall see hereafter, the integral may be made to satisfy any one reasonable condition. Nature of an Integral. 60. The differential of a function is the difference between two consecutive states of that function; hence, any state of the function whatever, is equal to some previous, or initial state, plus the algebraic sum of all the intermediate values of the differential. But this state is the integral, by definition; hence, if the arbitrary constant represents the initial state,...
