It is obvious that the cell must be accurately ground in order that the cover glass shall lie parallel to the object slide, or if not truly parallel, that the measurement of the depth of the cell and that of the displacement of the image be made at the same point. Since there is always a thin film of liquid between the cover glass and top of the cell, the value for  $A$  should be determined with the cell filled and all data necessary for the computation be made at once. This method gives values to three decimals for  $n$  of which two places at least will be correct and the third not far from the true value. Correct results are...
